Table of Contents

1. Alphabetical Listing of Instructions

M

N

O

P

R

S

X

2. Instructions Listed by Group

A. Load Immediate Data

B. Load and Store to an Immediate Address

C. 8-bit Indexed Load and Store

D. 16-bit Indexed Load and Store

E. 16-bit Load and Store to 20-bit Address

F. Register to Register Moves

G. Exchange

H. Stack Manipulation

I. 16-bit Arithmetic, Logical, and Rotate

J. 8-bit Arithmetic and Logical

K. 8-bit Bit Set, Reset, and Test

L. 8-bit Increment and Decrement

M. 8-bit Fast Accumulator

N. 8-bit Shift and Rotate

O. Instruction Prefixes

P. Block Moves

Q. Control, Jump, and Call

R. Miscellaneous

S. New Instructions

T. Privileged Instructions

3. Document Conventions

Instruction Table Key

- **`Opcode`**: A hexidecimal representation of the value that the mnemonic instruction represents.
- **`Instruction`**: The mnemonic syntax of the instruction.
- **`Clocks`**: The number of clock cycles it takes to complete this instruction. The numbers in parenthesis are a breakdown of the total clocks. The number of clocks instructions take follows a general patern. There are several Rabbit instructions that do not adhere to this pattern. Some instructions take more clocks and some have been enhanced to take fewer clocks.

Table 1: Clocks Breakdown

Process	Clocks
`Each byte of the opcode.`	2
`Each data byte read.`	2
`Write to memory or exteral IO.`	3
`Write to internal IO.`	2
`Internal operation or computation.`	1

- **`Operation`**: A symbolic representation of the operation performed.

ALTD, I/O and Flags Table Keys

Table 2: ALTD (“A” Column) Symbol Key

Flag			Description
F	R	SP	
•			ALTD selects alternate flags
	•		ALTD selects alternate destination register
		•	ALTD operation is a special case

Table 3: IOI and IOE (“I” Column) Symbol Key

Flag		Description
S	D	
	•	IOI and IOE affect destination
•		IOI and IOE affect source

Table 4: Flag Register Key

S	Z	L/V	C	Description
•				Sign flag affected
-				Sign flag not affected
	•			Zero flag affected
	-			Zero flag not affected
		L		LV flag contains logical check result
		V		LV flag set on arithmetic overflow result
		0		LV flag is cleared
		•		LV flag is affected
			•	Carry flag is affected
			-	Carry flag is not affected
			0	Carry flag is cleared
			1	Carry flag is set

Document Symbols Key

Table 5: Symbols

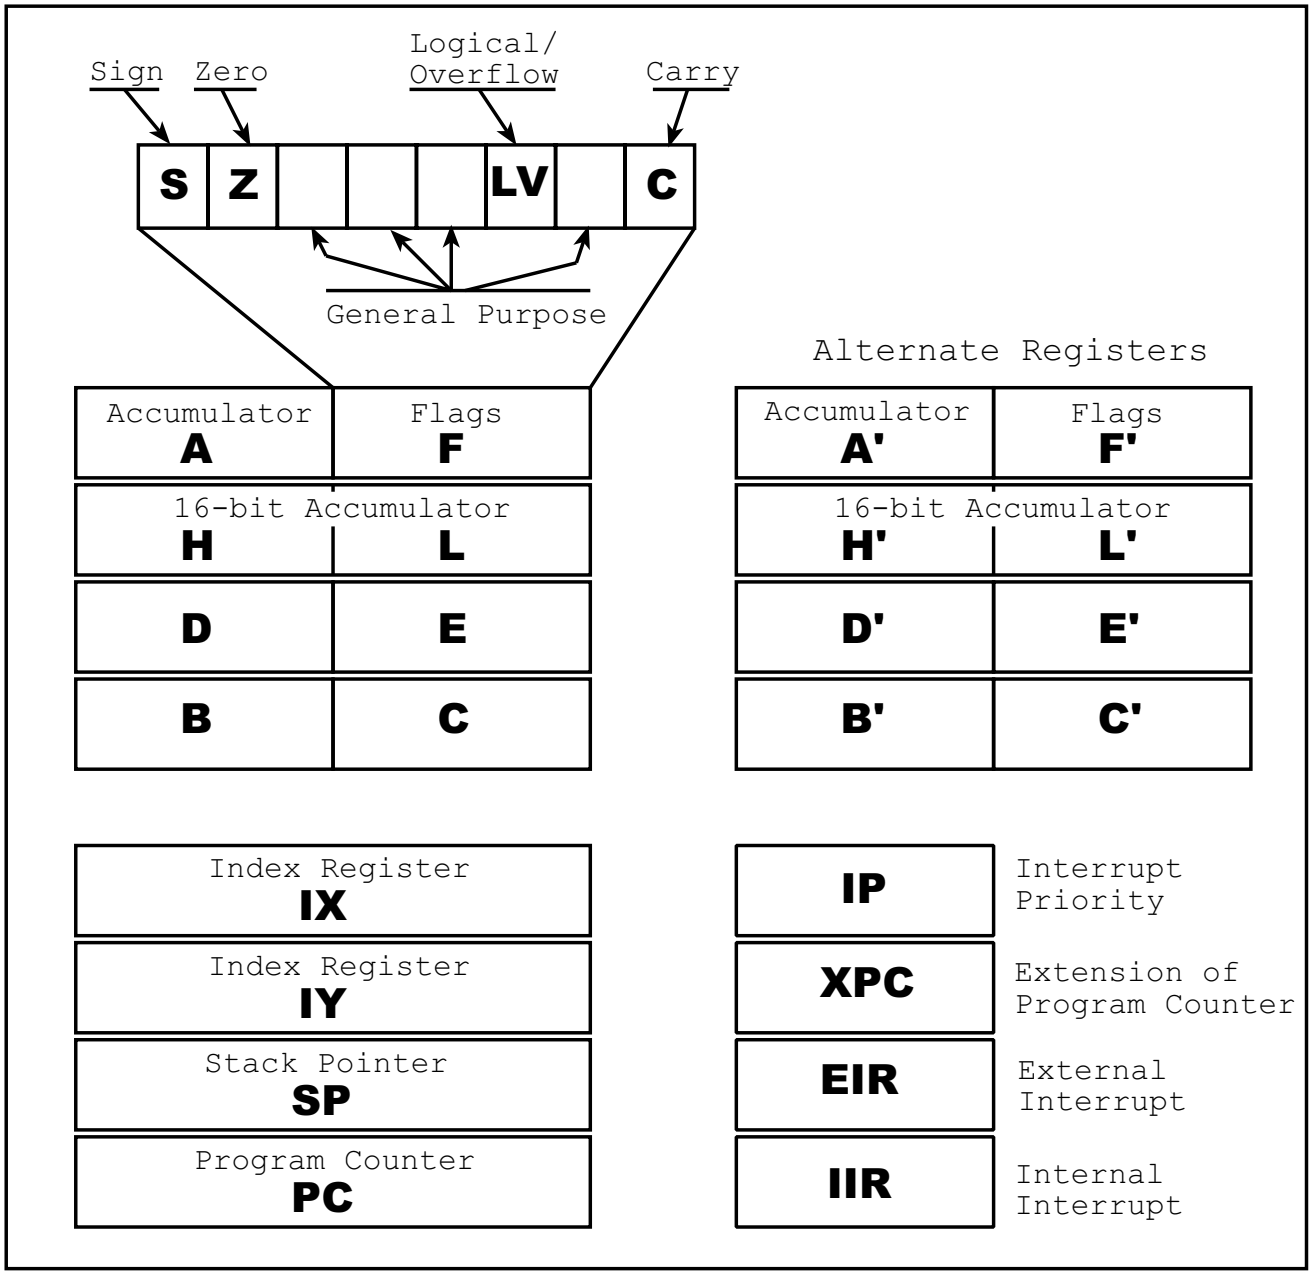
Rabbit	Z180	Meaning
b	*b*	Bit select (000 = bit 0, 001 = bit 1, 010 = bit 2, 011 = bit 3, 100 = bit 4, 101 = bit 5, 110 = bit 6, 111 = bit 7)
cc	*cc*	Condition code select (00 = NZ, 01 = Z, 10 = NC, 11 = C)
d	*d*	7-bit (signed) displacement. Expressed in two's complement.
dd	*ww*	word register select-destination (00 = BC, 01 = DE, 10 = HL, 11 = SP)
dd'		word register select-alternate(00 = BC', 01 = DE', 10 = HL')
e	*j*	8-bit (signed) displacement added to PC
f	*f*	condition code select (000 = NZ, 001 = Z, 010 = NC, 011 = C, 100 = LZ/NV, 101 = LO/V, 110 = P, 111 = M)
m	*m*	the most significant bits(MSB) of a 16-bit constant
mn	*mn*	16-bit constant
n	*n*	8-bit constant or the least significant bits(LSB) of a 16-bit constant
r, g	*g, g'*	byte register select (000 = B, 001 = C, 010 = D, 011 = E, 100 = H, 101 = L, 111 = A)
ss	*ww*	word register select-source (00 = BC, 01 = DE, 10 = HL, 11 = SP)
v	*v*	Restart address select (010 = 0020h, 011 = 0030h, 100 = 0040h, 101 = 0050h, 111 = 0070h)
x	*nbr*	an 8-bit constant to load into the XPC
xx	*xx*	word register select (00 = BC, 01 = DE, 10 = IX, 11 = SP)
yy	*yy*	word register select (00 = BC, 01 = DE, 10 = IY, 11 = SP)
zz	*zz*	word register select (00 = BC, 01 = DE, 10 = HL, 11 = AF)

Condition Codes

Table 6: Condition Code Description

Condition	Flag=Value	Description
NZ	Z=0	Not Zer0
Z	Z=1	Zero
NC	C=0	No Carry (C=0)
C	C=1	Carry (C=1)
P	S=0	Minus
M	S=1	Positive
LZ	L/V=0	For logic operations, Logic Zero (all of the four most significant bits of the result are zero)
NV	L/V=0	For arithmentic operations, No Overflow
LO	L/V=1	For logic operations, Logic One (one or more of the four most signif-icant bits of the result are one)
V	L/V=1	For arithmentic operations, Overflow

4. Processor Registers



5. OpCode Descriptions

ADC A,(HL)
ADC A,(IX+*d*)
ADC A,(IY+*d*)

Opcode	Instruction	Clocks	Operation
8E	ADC A,(HL)	5 (2,1,2)	A= A + (HL) + CF
DD 8E *d*	ADC A,(IX+*d*)	9 (2,2,2,1,2)	A= A + (IX+*d*) + CF
FD 8E *d*	ADC A,(IY+*d*)	9 (2,2,2,1,2)	A= A + (IY+*d*) + CF

Flags							
S	Z				L/V		C
•	•				V		•

ALTD		
F	R	SP
•	•	

I/O	
S	D
•	

Description

The data in the Accumulator is summed with the Carry Flag and with the data in memory whose location is:

- held in word register HL, or
- the sum of the data in index register IX and a displacement value *d*, or
- the sum of the data in index register IY and a displacement value *d*.

The result is then stored in the Accumulator.

ADC A,*n*

Opcode	Instruction	Clocks	Operation
CE *n*	ADC A,*n*	4 (2,2)	A = A + *n* + CF

Flags							
S	Z				L/V		C
•	•				V		•

ALTD		
F	R	SP
•	•	

I/O	
S	D

Description

The 8-bit constant *n* is summed with the Carry Flag and with the data in the Accumulator. The sum is then stored in the Accumulator.

ADC A,*r*

Opcode	Instruction	Clocks	Operation
—	**ADC A,*r***	**2**	**A = A + *r* + CF**
8F	ADC A,A	2	A = A + A + CF
88	ADC A,B	2	A = A + B + CF
89	ADC A,C	2	A = A + C + CF
8A	ADC A,D	2	A = A + D + CF
8B	ADC A,E	2	A = A + E + CF
8C	ADC A,H	2	A = A + H + CF
8D	ADC A,L	2	A = A + L + CF

Flags							
S	Z				L/V		C
•	•				V		•

ALTD		
F	R	SP
•	•	

I/O	
S	D

Description

The data in the Accumulator is summed with the Carry Flag, CF, and with the data in register *r* (any of the registers A, B, C, D, E, H, or L). The result is stored in the Accumulator.

ADC HL,*ss*

Opcode	Instruction	Clocks	Operation
——	**ADC HL,*ss***	**4 (2,2)**	**HL = HL + *ss* + CF**
ED 4A	ADC HL,BC	4 (2,2)	HL = HL + BC + CF
ED 5A	ADC HL,DE	4 (2,2)	HL = HL + DE + CF
ED 6A	ADC HL,HL	4 (2,2)	HL = HL + HL + CF
ED 7A	ADC HL,SP	4 (2,2)	HL = HL + SP + CF

Flags							
S	Z				L/V		C
•	•				V		•

ALTD		
F	R	SP
•	•	

I/O	
S	D

Description

The data in the register pair HL is summed with the Carry Flag and with the data in word register *ss* (any of the word registers BC, DE, HL, or SP). The result is stored in HL.

ADD A,(HL)
ADD A,(IX+*d*)
ADD A,(IY+*d*)

Opcode	Instruction	Clocks	Operation
86	ADD A,(HL)	5 (2,1,2)	A = A + (HL)
DD 86 *d*	ADD A,(IX+*d*)	9 (2,2,2,1,2)	A = A + (IX+*d*)
FD 86 *d*	ADD A,(IY+*d*)	9 (2,2,2,1,2)	A = A + (IY+*d*)

Flags							
S	Z				L/V		C
•	•				V		•

ALTD		
F	R	SP
•	•	

I/O	
S	D
•	

Description

The data in the Accumulator is summed with the data in the memory location whose address is:

- held in word register HL, or
- the sum of the data in index register IX and a displacement value *d*, or
- the sum of the data in index register IY and a displacement value *d*.

The result is stored in the Accumulator.

ADD A,*n*

Opcode	Instruction	Clocks	Operation
C6 *n*	ADD A,*n*	4 (2,2)	A = A + *n*

Flags							
S	Z				L/V		C
•	•				V		•

ALTD		
F	R	SP
•	•	

I/O	
S	D

Description

The data in the Accumulator is summed with the 8-bit constant *n*. The result is stored in the Accumulator.

ADD A,*r*

Opcode	Instruction	Clocks	Operation
——	**ADD A,*r***	**2**	**A = A + *r***
87	ADD A,A	2	A = A + A
80	ADD A,B	2	A = A + B
81	ADD A,C	2	A = A + C
82	ADD A,D	2	A = A + D
83	ADD A,E	2	A = A + E
84	ADD A,H	2	A = A + H
85	ADD A,L	2	A = A + L

Flags							
S	Z				L/V		C
•	•				V		•

ALTD		
F	R	SP
•	•	

I/O	
S	D

Description

The data in the Accumulator is summed with the data in register *r* (any of the registers A, B, C, D, E, H, or L). The result is stored in the Accumulator.

ADD HL,*ss*

Opcode	Instruction	Clocks	Operation
——	**ADD HL,*ss***	**2**	**HL = HL + *ss***
09	ADD HL,BC	2	HL = HL + BC
19	ADD HL,DE	2	HL = HL + DE
29	ADD HL,HL	2	HL = HL + HL
39	ADD HL,SP	2	HL = HL + SP

Flags							
S	Z				L/V		C
-	-				-		•

ALTD		
F	R	SP
•	•	

I/O	
S	D

Description

The data in the word register HL is summed with the data in the word register *ss* (any of the word registers BC, DE, HL, or SP). The result is stored in HL.

ADD IX,*xx*
ADD IY,*yy*

Opcode	Instruction	Clocks	Operation
——	**ADD IX,*xx***	**4 (2,2)**	**IX = IX + *xx***
DD 09	ADD IX,BC	4 (2,2)	IX = IX + BC
DD 19	ADD IX,DE	4 (2,2)	IX = IX + DE
DD 29	ADD IX,IX	4 (2,2)	IX = IX + IX
DD 39	ADD IX,SP	4 (2,2)	IX = IX + SP
——	**ADD IY,*yy***	**4 (2,2)**	**IY = IY + *yy***
FD 09	ADD IY,BC	4 (2,2)	IY = IY + BC
FD 19	ADD IY,DE	4 (2,2)	IY = IY + DE
FD 29	ADD IY,IY	4 (2,2)	IY = IY + IY
FD 39	ADD IY,SP	4 (2,2)	IY = IY + SP

Flags							
S	Z				L/V		C
-	-				-		•

ALTD		
F	R	SP
•		

I/O	
S	D

Description

The data in index register IX is summed with the word register *xx* (any of the word registers BC, DE, IX, or SP) and the result is stored in IX.

The data in index register IY is summed with the word register *yy* (any of the word registers BC, DE, IY, or SP). The result is stored in IY.

ADD SP,*d*

Opcode	Instruction	Clocks	Operation
27 *d*	ADD SP,*d*	4 (2,2)	SP = SP + *d*

Flags							
S	Z						C
-	-				-		•

ALTD		
F	R	SP
•		

I/O	
S	D

Description

The data in the Stack Pointer register is summed with the 7-bit signed displacement *d*, and then stored in SP. This instruction is implemented for the Rabbit and is not available for the Z180.

ALTD

Opcode	Instruction	Clocks	Operation
76	ALTD	2	[Sets alternate register destination for following instruction.]

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP

I/O	
S	D

Description

This is an instruction prefix. Causes the instruction immediately following to affect the alternate flags, or use the alternate registers for the destination of the data, or both. For some instructions ALTD causes special alternate register uses, unique to that instruction. This instruction is implemented for the Rabbit and is not available for the Z180

Example

The instruction

```
ALTD ADD HL,DE
```

would add the data in word register DE to the data in word register HL and store the result in the alternate word register HL'.

The instructions

```
ALTD LD DE,BC
```

and

```
LD DE',BC
```

both load the data in word register BC into the alternate word register DE'.

AND (HL)
AND (IX+*d*)
AND (IY+*d*)

Opcode	Instruction	Clocks	Operation
A6	AND (HL)	5 (2,1,2)	A = A & (HL)
DD A6 *d*	AND (IX+*d*)	9 (2,2,2,1,2)	A = A & (IX+*d*)
FD A6 *d*	AND (IY+*d*)	9 (2,2,2,1,2)	A = A & (IY+*d*)

Flags							
S	**Z**				**L/V**		**C**
•	•				L		0

ALTD		
F	**R**	**SP**
•	•	

I/O	
S	**D**
•	

Description

Performs a logical AND operation between the byte in the Accumulator and the byte whose address is:

- in word register HL, or
- the sum of the data in index register IX and a displacement value *d*, or
- the sum of the data in index register IY and a displacement value *d*.

The relative bits of each byte are compared (i.e., the bit 1 of both bytes are compared, the bit 2 of both bytes are compared, etc.) and the associated bit in the result byte is set only if both the compared bits are set. The result is stored in the Accumulator.

Example

If the byte in the Accumulator contains the bits 1011 1100 and the byte at memory location HL contains the bits 1101 0101, then the execution of the instruction:

```
AND (HL)
```

would result in the byte in the Accumulator becoming 1001 0100.

AND HL,DE

Opcode	Instruction	Clocks	Operation
DC	AND HL,DE	2	HL = HL& DE

Flags							
S	Z				L/V		C
•	•				L		0

ALTD		
F	R	SP
•	•	

I/O	
S	D

Description

Performs a logical AND operation between the word in word register HL and the word in word register DE. The relative bits of each byte are compared (i.e., the bit 1 of both bytes are compared, the bit 2 of both bytes are compared, etc.) and the associated bit in the result byte is set only if both the compared bits are set. The result is stored in HL. This instruction is implemented for the Rabbit and is not available for the Z180.

AND IX,DE
AND IY,DE

Opcode	Instruction	Clocks	Operation
DD DC	AND IX,DE	4 (2,2)	IX = IX & DE
FD DC	AND IY,DE	4 (2,2)	IY = IY & DE

Flags							
S	Z				L/V		C
•	•				L		0

ALTD		
F	R	SP
•		

I/O	
S	D

Description

- **AND IX,DE** performs a logical AND operation between the word in index register IX and the word in word register DE. The result is stored in IX.
- **AND IY,DE** performs a logical AND operation between the word in index register IY and the word in word register DE. The result is stored in IY.

The relative bits of each byte are compared (i.e., the bit 1 of both bytes are compared, the bit 2 of both bytes are compared, etc.) and the associated bit in the result byte is set only if both the compared bits are set. These instructions are implemented for the Rabbit and are not available for the Z180.

AND *n*

Opcode	Instruction	Clocks	Operation
E6 *n*	AND *n*	4 (2,2)	A = A & *n*

Flags							
S	Z				L/V		C
•	•				L		0

ALTD		
F	R	SP
•	•	

I/O	
S	D

Description

Performs a logical AND operation between the byte in the Accumulator and the 8-bit constant *n*. The relative bits of each byte are compared (i.e., the bit 1 of both bytes are compared, the bit 2 of both bytes are compared, etc.) and the associated bit in the result byte is set only if both the compared bits are set. The result is stored in the Accumulator.

AND *r*

Opcode	Instruction	Clocks	Operation
——	**AND *r***	**2**	**A = A & *r***
A7	AND A	2	A = A & A
A0	AND B	2	A = A & B
A1	AND C	2	A = A & C
A2	AND D	2	A = A & D
A3	AND E	2	A = A & E
A4	AND H	2	A = A & H
A5	AND L	2	A = A & L

Flags							
S	Z				L/V		C
•	•				L		0

ALTD		
F	R	SP
•	•	

I/O	
S	D

Description

Performs a logical AND operation between the byte in the Accumulator and the byte in the register *r* (any of the registers A, B, C, D, E, H, or L). The relative bits of each byte are compared (i.e., the bit 1 of both bytes are compared, the bit 2 of both bytes are compared, etc.) and the associated bit in the result byte is set only if both the compared bits are set. The result is stored in the Accumulator.

BIT *b*,(HL)
BIT *b*,(IX+*d*)
BIT *b*,(IY+*d*)

Opcode	Instruction	Clocks	Operation
——	**BIT *b*,(HL)**	**7 (2,2,1,2)**	**(HL) & bit**
CB 46	BIT 0,(HL)	7 (2,2,1,2)	(HL) & bit 0
CB 4E	BIT 1,(HL)	7 (2,2,1,2)	(HL) & bit 1
CB 56	BIT 2,(HL)	7 (2,2,1,2)	(HL) & bit 2
CB 5E	BIT 3,(HL)	7 (2,2,1,2)	(HL) & bit 3
CB 66	BIT 4,(HL)	7 (2,2,1,2)	(HL) & bit 4
CB 6E	BIT 5,(HL)	7 (2,2,1,2)	(HL) & bit 5
CB 76	BIT 6,(HL)	7 (2,2,1,2)	(HL) & bit 6
CB 7E	BIT 7,(HL)	7 (2,2,1,2)	(HL) & bit 7
——	**BIT *b*,(IX+*d*)**	**10 (2,2,2,2,2)**	**(IX+*d*) & bit**
DD CB *d* 46	BIT 0,(IX+*d*)	10 (2,2,2,2,2)	(IX+*d*) & bit 0
DD CB *d* 4E	BIT 1,(IX+*d*)	10 (2,2,2,2,2)	(IX+*d*) & bit 1
DD CB *d* 56	BIT 2,(IX+*d*)	10 (2,2,2,2,2)	(IX+*d*) & bit 2
DD CB *d* 5E	BIT 3,(IX+*d*)	10 (2,2,2,2,2)	(IX+*d*) & bit 3
DD CB *d* 66	BIT 4,(IX+*d*)	10 (2,2,2,2,2)	(IX+*d*) & bit 4
DD CB *d* 6E	BIT 5,(IX+*d*)	10 (2,2,2,2,2)	(IX+*d*) & bit 5
DD CB *d* 76	BIT 6,(IX+*d*)	10 (2,2,2,2,2)	(IX+*d*) & bit 6
DD CB *d* 7E	BIT 7,(IX+*d*)	10 (2,2,2,2,2)	(IX+*d*) & bit 7
——	**BIT *b*,(IY+*d*)**	**10 (2,2,2,2,2)**	**(IY+*d*) & bit**
FD CB *d* 46	BIT 0,(IY+*d*)	10 (2,2,2,2,2)	(IY+*d*) & bit 0
FD CB *d* 4E	BIT 1,(IY+*d*)	10 (2,2,2,2,2)	(IY+*d*) & bit 1
FD CB *d* 56	BIT 2,(IY+*d*)	10 (2,2,2,2,2)	(IY+*d*) & bit 2
FD CB *d* 5E	BIT 3,(IY+*d*)	10 (2,2,2,2,2)	(IY+*d*) & bit 3
FD CB *d* 66	BIT 4,(IY+*d*)	10 (2,2,2,2,2)	(IY+*d*) & bit 4
FD CB *d* 6E	BIT 5,(IY+*d*)	10 (2,2,2,2,2)	(IY+*d*) & bit 5
FD CB *d* 76	BIT 6,(IY+*d*)	10 (2,2,2,2,2)	(IY+*d*) & bit 6
FD CB *d* 7E	BIT 7,(IY+*d*)	10 (2,2,2,2,2)	(IY+*d*) & bit 7

Flags							
S	Z				L/V		C
-	•				-		-

ALTD		
F	R	SP
•		

I/O	
S	D
•	

Description

Tests the bit *b* (any of the bits 0, 1, 2, 3, 4, 5, 6, or 7) of the byte whose address is:

- contained in the register pair HL, or
- the sum of data in index register IX plus a displacement value *d*, or
- the data in index register IY plus a displacement value *d*.

The Zero Flag, Z, is set if the tested bit is 0, reset the bit is 1.

BIT b,(HL) is a privileged instruction.

BIT *b,r*

Opcode								Instruction	Clocks	Operation
b,r	*A*	*B*	*C*	*D*	*E*	*H*	*L*	BIT b,r	4(2,2)	r & bit
CB (0)	*47*	40	41	42	43	44	45			
CB (1)	4F	48	49	4A	4B	4C	4D			
CB (2)	57	50	51	52	53	54	55			
CB (3)	5F	58	59	5A	5B	5C	5D			
CB (4)	67	60	61	62	63	64	65			
CB (5)	6F	68	69	6A	6B	6C	6D			
CB (6)	77	70	71	72	73	74	75			
CB (7)	7F	78	79	7A	7B	7C	7D			

Flags							
S	Z				L/V		C
-	•				-		-

ALTD		
F	R	SP
•		

I/O	
S	D

Description

Tests the bit *b* (any of the bits 0, 1, 2, 3, 4, 5, 6, or 7) of the byte in the register *r* (any of the registers A, B, C, D, E, H, or L).

The Zero Flag, Z, is set if the tested bit is 0, reset if the bit is 1.

BOOL HL

Opcode	Instruction	Clocks	Operation
CC	BOOL HL	2	If (HL != 0) HL = 1

Flags							
S	Z				L/V		C
•	•				0		0

ALTD		
F	R	SP
•	•	

I/O	
S	D

Description

If the data in word register HL does not equal zero, then it is set to 1. This instruction is implemented for the Rabbit and is not available for the Z180.

BOOL IX
BOOL IY

Opcode	Instruction	Clocks	Operation
DD CC	BOOL IX	4 (2,2)	If (IX != 0) IX = 1
FD CC	BOOL IY	4 (2,2)	If (IY != 0) IY = 1

Flags							
S	Z				L/V		C
•	•				0		0

ALTD		
F	R	SP
•		

I/O	
S	D

Description

If the data in index register IX or IY does not equal zero, then that register is set to 1. These instructions are implemented for the Rabbit and are not available for the Z180.

CALL *mn*

Opcode	Instruction	Clocks	Operation
CD *n m*	CALL *mn*	12 (2,2,2,3,3)	(SP - 1) = $PC_{(high)}$; (SP - 2) = $PC_{(low)}$; PC = *mn*; SP = SP - 2

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP

I/O	
S	D

Description

This instruction is used to call a subroutine. First the data in the Program Counter is pushed onto the stack. The high-order byte of the PC is pushed first, then the low-order byte. The program counter is then loaded with *mn*,16-bit address of the first instruction of the subroutine. The Stack Pointer is updated to reflect the two bytes pushed onto the stack.

The Dynamic C assembler recognizes **CALL *label***, where ***mn*** is coded as a label.

CCF

Opcode	Instruction	Clocks	Operation
3F	CCF	2	CF = ~CF

Flags							
S	Z				L/V		C
-	-				-		•

ALTD		
F	R	SP
•		

I/O	
S	D

Description

The Carry Flag is inverted: If it is set, it becomes cleared. If it is not set, it becomes set.

CP (HL)
CP (IX+*d*)
CP (IY+*d*)

Opcode	Instruction	Clocks	Operation
BE	CP (HL)	5 (2,1,2)	A - (HL)

Description

Compares the data in the Accumulator with the data whose address is (a) contained in word register HL, (b) the sum of the data in index register IX plus a displacement value *d*, or (c) the sum of the data in index register IY plus a displacement value *d*.

These compares are accomplished by subtracting the appropriate data ((HL), (IX+*d*), or (IY+*d*)) from the Accumulator. If the value of the data in the Accumulator is less than the value of the data compared, then the Sign Flag and the Carry Flag are set. If they are equal, the Zero Flag is set. If the data is greater than the data in the Accumulator, then the Sign, Carry, and Zero Flags are reset. This operation does not affect the data in the Accumulator.

CP *n*

Opcode	Instruction	Clocks	Operation
FE *n*	CP *n*	4 (2,2)	A - *n*

Flags

Description

Compares the data in the Accumulator with an 8-bit constant *n*. This compare is accomplished by subtracting *n* from the Accumulator. If the value of the data in the Accumulator is less than the value of *n*, then the Sign Flag and the Carry Flag are set. If they are equal, the Zero Flag is set. If *n* is greater than the data in the Accumulator, then the Sign, Carry, and Zero Flags are reset. This operation does not affect the data in the Accumulator.

	•	

I/O	
S	D

Description

Decrements the data in word register *ss* (any of the word registers BC, DE, HL, or SP).

DJNZ *e*

Opcode	Instruction	Clocks	Operation
10 *e*-2	DJNZ *e*	5 (2,2,1)	B = B-1; if {B != 0} PC = PC + *e*

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP
	•	

I/O	
S	D

Description

This instruction's mnemonic stands for Decrement and Jump if Not Zero. It decrements the data in register B then, if the data in B does not equal 0, it adds the 8-bit signed constant *e* to the Program Counter.

Two is subtracted from the value *e* so the instruction jumps from the current instruction and not the following instruction.

EX (SP),HL

Opcode	Instruction	Clocks	Operation
ED 54	EX (SP),HL	15 (2,2,1,2,2,3,3)	H <–> (SP+1); L <–> (SP)

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP
	•	

I/O	
S	D

Description

Exchanges the byte in the register H with the data whose address is the data in the Stack Pointer register plus 1; and exchanges the byte in the register L with the data whose address is the data in the Stack Pointer . This instruction has been modified from the Z180 instruction.

EX (SP),IX
EX (SP),IY

Opcode	Instruction	Clocks	Operation
DD E3	EX (SP),IX	15 (2,2,1,2,2,3,3)	$IX_{(high)}$ <–> (SP+1); $IX_{(low)}$ <–> (SP)

Increments the data in word register *ss* (any of the word registers BC, DE, HL, or SP).

IOE
IOI

Opcode	Instruction	Clocks	Operation
DD	IOE	2	I/O external prefix
D3	IOI	2	I/O internal prefix

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP

I/O	
S	D

Description

These instructions are implemented for the Rabbit and are not available for the Z180.

- **IOI:** The IOI prefix allows the use of existing memory access instructions as internal I/O instructions. When prefixed, a 16-bit memory instruction accesses the I/O space at the address specified by the lower byte of the 16-bit address. With IOI, the upper byte of a 16-bit address is ignored since internal I/O peripherals are mapped within the first 256-bytes of the I/O address space. Writes to internal I/O registers require two clocks rather than the three required for memory write operations.
- **IOE:** The IOE prefix allows the use of existing memory access instructions as external I/O instructions. Unlike internal I/O peripherals, external I/O devices can be mapped within 8K of the available 64K address space. Therefore, prefixed 16-bit memory access instructions can be used more appropriately for external I/O operations. By default, writes are inhibited for external I/O operations and fifteen wait states are added for I/O accesses.

WARNING: If an I/O prefixed instruction is immediately followed by one of these 12 special one byte memory access instructions, a bug in the Rabbit 2000 causes I/O access to occur instead of memory access:

```
ADC A,(HL)      CP (HL)         SUB (HL)        INC (HL)
ADD A,(HL)      OR (HL)         XOR (HL)        LD r,(HL)
AND (HL)        SBC A,(HL)      DEC (HL)        LD (HL),r
```

This bug can be avoided by putting a **NOP** instruction between an I/O instruction and any of the aforementioned instructions. Dynamic C versions 6.57 and later will automatically compensate for the bug. And the Rabbit 3000 eliminated it.

Examples

The following instruction loads the contents of the Accumulator into the internal I/O register at address location 030h:

```
IOI  LD (030h), A
```

These next instructions read a word from external I/O address 0A002:

```
LD  IX, 0A000h
IOE  LD HL, (IX+2)
```

IPSET 0
IPSET 1
IPSET 2
IPSET 3

Opcode	Instruction	Clocks	Operation
ED 46	IPSET 0	4 (2,2)	IP = {IP[5:0], 00}
ED 56	IPSET 1	4 (2,2)	IP = {IP[5:0], 01}
ED 4E	IPSET 2	4 (2,2)	IP = {IP[5:0], 10}
ED 5E	IPSET 3	4 (2,2)	IP = {IP[5:0], 11}

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP

I/O	
S	D

Description

The Interrupt Priority Register, IP is an 8-bit register that forms a stack of the current priority and the other previous 3 priorities. IPSET 0 forms the lowest priority; IPSET 3 forms the highest priority. These instructions are privileged. They are implemented for the Rabbit and are not available for the Z180.

- **IPSET 0:** The IPSET 0 instruction shifts the contents of the register holding the previous priorities 2-bits to the left, then sets the Interrupt Priority Register (bits 0 and 1) to 00.
- **IPSET 1:** The IPSET 1 instruction first shifts the contents of the register holding the previous priorities 2-bits to the left, then sets the Interrupt Priority Register (bits 0 and 1) to 01.
- **IPSET 2:** The IPSET 2 instruction shifts the contents of the register holding the previous priorities 2-bits to the left, then sets the Interrupt Priority Register (bits 0 and 1) to 10.
- **IPSET 3:** The IPSET 3 instruction shifts the contents of the register holding the previous priorities 2-bits to the left, then sets the Interrupt Priority Register (bits 0 and 1) to 11.

Processor Priority	Effect on Interrupts
0	All interrupts, priority 1,2 and 3 take place after execution of current non privileged instruction.
1	Only interrupts of priority 2 and 3 take place after execution of current non privileged instruction.
2	Only interrupts of priority 3 take place after execution of current non privileged instruction.
3	All interrupts are suppressed (except the RST instruction).

IPRES

Opcode	Instruction	Clocks	Operation
ED 5D	IPRES	4 (2,2)	IP = {IP[1:0], IP[7:2]}

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP

I/O	
S	D

Description

The IPRES instruction rotates the contents of the Interrupt Priority Register 2-bits to the right, replacing the current priority with the previous priority. It is impossible to interrupt during the execution of this instruction. This instruction is privileged. It is implemented for the Rabbit and is not available for the Z180.

Example

If the Interrupt Priority register contains 00000110, the execution of the instruction

```
IPRES
```

would cause the Interrupt Priority register to contain 10000001.

JP (HL)
JP (IX)

S	D

Description

Adds a signed constant *e* to the Program Counter.

Since the instruction takes two increments of the PC to complete, two is subtracted from the displacement value so that the displacement take place from the instruction opcode.

This instruction recognizes labels when used in the Dynamic C assembler.

LCALL *x,mn*

Opcode	Instruction	Clocks	Operation
CF *n m x*	LCALL *x,mn*	19 (2,2,2,2,1,3,3,3,1)	(SP - 1) = $PC_{(low)}$; (SP - 2) = $PC_{(high)}$; (SP - 3) = XPC; XPC = *x*; PC = *mn*; SP = SP - 3

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP

I/O	
S	D

Description

This instruction is similar to the CALL routine in that it transfers program execution to the subroutine address specified by the 16-bit operand *mn*. The LCALL instruction is special in that it allows calls to be made to a computed address in XMEM. Note that the value of XPC and consequently the address space defined by the XPC is dynamically changed with the LCALL instructions.

In the LCALL instruction, first the Extension of the Program Counter, XPC, is pushed onto the stack. Next the Program Counter, PC, is pushed onto the stack, the high order byte first, then the low order byte. Then the XPC is loaded with the 8-bit value *x* and the PC is loaded with the 16-bit value, *mn*. The Stack Pointer register is then updated to reflect the three items pushed onto it.

The value *mn* must be in the range E000–FFFF.

This instruction is implemented for the Rabbit and is not available for the Z180.

Alternate Forms

The Dynamic C assembler recognizes several other forms of this instruction.

LCALL *label*

LCALL *x,label*

LCALL *x*:*label*

LCALL *x*:*mn*

The parameter *label* is a user defined label. The colon is equivalent to the comma as a delimiter.

Description

- **LDD:** Loads the memory location whose address is in word register DE with the data at the address in word register HL. Then it decrements the data in word registers BC, DE, and HL.
- **LDDR:** While the data in the register pair BC does not equal 0 then the memory location whose address is in word register DE is loaded with the data at the address in word register HL. Then it decrements the data in word registers BC, DE, and HL. The instruction then repeats until BC equals zero.
- **LDI:** Loads the memory location whose address is in word register DE with the data at the address in word register HL. Then the data in word register BC is decremented and the data in word registers DE and HL is incremented.
- **LDIR:** While the data in the register pair BC does not equal 0 then the memory location whose address is in word register DE is loaded with the data at the address in word register HL. Then the data in word register BC is decremented and the data in word registers DE and HL are incremented. The instruction then repeats until BC equals zero.

If any of these block move instructions are prefixed by IOI or IOE, the destination will be in the specified I/O space. Add 1 clock for each iteration for the prefix if the prefix is IOI (internal I/O). If the prefix is IOE, add 2 clocks plus the number of I/O wait states enabled. The V flag is cleared when BC transitions from 1 to 0. If the V flag is not cleared another step is performed for the repeating versions of the instructions. Interrupts can occur between different repeats, but not within an iteration equivalent to LDD or LDI. Return from the interrupt is to the first byte of the instruction which is the I/O prefix byte if there is one.

LDP (HL),HL
LDP (IX),HL
LDP (IY),HL

Opcode	Instruction	Clocks	Operation
ED 64	LDP (HL),HL	12 (2,2,2,3,3)	(HL) = L; (HL + 1) = H. (Addr[19:16] = A[3:0])

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP

I/O	
S	D

Description

These instructions are used to access 20-bit addresses. In all cases, the four most significant bits of the 20-bit address (bits 19 through 16) are defined as the four least significant bits of the Accumulator (bits 3 though 0). The LDP instructions bypass the MMU's address translation unit for direct access to the 20-bit memory address space. These instructions are implemented for the Rabbit and are not available for the Z180.

- **LDP (HL),HL:** Loads the memory location whose 16 least significant bits of its 20-bit address are the data in paired register HL with the data in the register L, and then loads the following 20-bit address with the data in the register H.
- **LDP (IX),HL:** Loads the memory location whose 16 least significant bits of its 20-bit address are the data in index register IX with the data in the register L, and then loads the following 20-bit address with the data in the register H.
- **LDP (IY),HL:** Loads the memory location whose 16 least significant bits of its 20-bit address are the data in index register IY with the data in the register L, and then loads the following 20-bit address with the data in the register H.

Note that the LDP instructions wrap around on a 64K page boundary. Since the LDP instruction operates on two-byte values, the second byte will wrap around and be written at the start of the page if you try to read or write across a page boundary. Thus, if you fetch or store at address 0xn,0xFFFF, you will get the bytes located at 0xn, 0xFFFF and 0xn,0x0000 instead of 0xn,0xFFFF and 0x(n+1),0x0000 as you might expect. Therefore, do not use LDP at any physical address ending in 0xFFFF.

LJP *x,mn*

Opcode	Instruction	Clocks	Operation
C7 *n m x*	LJP *x,mn*	10 (2,2,2,2,2)	XPC = *x*; PC = *mn*

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP

I/O	
S	D

Description

This instruction is similar to the **JP mn** instruction in that it transfers program execution to the memory location specified by the 16-bit address, mn. **LJP** is special in that it allows a jump to be made to a computed address in XMEM. Note that the value of XPC and consequently the address space defined by the XPC is dynamically changed with the **LJP** instructions.

The instruction loads the XPC, with the 8-bit constant *x*. Then loads the Program Counter, PC, with the 16-bit constant *mn*, which must be in the range E000–FFFF.

This instruction recognizes labels when used in the Dynamic C assembler. This instruction is implemented for the Rabbit and is not available for the Z180.

LRET

Opcode	Instruction	Clocks	Operation
ED 45	LRET	13 (2,2,1,2,2,2,2)	$PC_{(low)}$ = (SP); $PC_{(high)}$ = (SP+1); XPC = (SP + 2); SP = SP + 3

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP

I/O	
S	D

Description

The LRET transfers execution from a subroutine to the calling program by popping the Program Counter and the XPC off of the Stack, in order to return from a LCALL operation.

The instruction first loads the low order byte of the Program Counter with the data whose address is the data in the Stack Pointer, SP. Then it loads the high order byte of the PC with the data in whose address is the sum data in the SP and 1. Then it loads the Extension of the Program Counter, the XPC, with the data whose address is the data in the SP plus 2. Finally it adds three to the value in the SP and stores the result in the SP

This instruction is implemented for the Rabbit and is not available for the Z180.

MUL

Opcode	Instruction	Clocks	Operation
F7	MUL	12 (2,10)	HL:BC = BC • DE

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP

I/O	
S	D

Description

A multiplication operation is performed on the contents of the 16-bit binary integers contained in the BC and DE registers. The signed 32-bit result is placed in the HL (bits 31 through 16) and BC (bits 15 through 0) registers.

If the multiplier is negative, the hardware takes its 2's-complement as multiplication is being performed. If the multiplier is positive, it is passed unchanged. If there is a carry from this stage of the 2's complement operation, it is passed to the next stage.

This instruction is implemented for the Rabbit and is not available for the Z180.

Examples:

```
LD BC, 0FFFFh    ;BC gets -1
LD DE, 0FFFFh    ;DE gets -1
MUL              ;HL|BC = 1, HL gets 0000h, BC gets 0001h
```

In the above example, the 2's complement of FFFFh is 0001h.

```
LD BC, 0FFFFh    ;BC gets -1
LD DE, 00001h    ;DE gets 1
MUL              ;HL|BC = -1, HL gets FFFFh, BC gets FFFFh
```

NEG

Opcode	Instruction	Clocks	Operation
ED 44	NEG	4 (2,2)	A = 0 - A

Flags

DD B6 *d*	OR (IX+*d*)	9 (2,2,2,1,2)	A = A | (IX+*d*)
FD B6 *d*	OR (IY+*d*)	9 (2,2,2,1,2)	A = A | (IY+*d*)

Flags							
S	Z				L/V		C
•	•				L		0

ALTD		
F	R	SP
•	•	

I/O	
S	D
•	

Description

Performs a logical OR operation between the byte in the Accumulator and the byte whose address is (a) in the word register HL, (b) the sum of the data in index register IX and a displacement *d*, or (c) the sum of the data in index register IY and a displacement *d*.

The relative bits of each byte are compared (i.e., the bit 1 of both bytes are compared, the bit 2 of both bytes are compared, etc.) and the associated bit in the result byte is set if either of the compared bits is set. The result is stored in the Accumulator.

Example

If the byte in the Accumulator is 0100 1100 and the byte in the memory location pointed to by HL is 1110 0101, the operation:

```
OR (HL)
```

would result in the Accumulator containing 1110 1101.

ALTD		
F	**R**	**SP**

I/O	
S	**D**

Description

Loads the memory location with the address 1 less than the data in the Stack Pointer, SP, with the high order byte of the data in word register *zz* (any of the word register AF, BC, DE, or HL), and loads the memory location with the address two less than the data in SP with the low order byte of the data in *zz*. Then SP is decremented twice.

I/O	
S	D
	•

Description

Resets bit *b* (any of the bits 0, 1, 2, 3, 4, 5, 6, or 7) of the data whose address is:

- held in word register HL, or
- the sum of the data in index register IX and a displacement *d*, or
- the sum of the data in index register IX and a displacement *d*.

The bit is reset by performing a logical AND between the selected bit and its complement.

S	D

Description

Resets bit *b* (any of the bits 0, 1, 2, 3, 4, 5, 6, or 7) of the data whose address is held in the register *r* (any of the register A, B, C, D, E, H, or L).

The bit is reset by performing a logical AND between the selected bit and its complement.

RET

Opcode	Instruction	Clocks	Operation
C9	RET	8 (2,1,2,2,1)	$PC_{(low)}$ = (SP); $PC_{(high)}$ = (SP + 1); SP = SP + 2

Flags							
S	Z				L/V		C
-	-				-		-

ALTD		
F	R	SP

I/O	
S	D

Description

RET transfers execution from a subroutine to the program that called it. First it loads the low order byte of the Program Counter, PC, with the data at the memory address in the Stack Pointer, SP, then loads the high order byte of PC with the data at the memory address immediately following the one held in SP. The data in SP is then incremented twice.

RET *f*

Opcode	Instruction	Operation
——	**RET *f***	**If {*f*} $PC_{(low)}$ = (SP); $PC_{(high)}$ = (SP + 1); SP = SP + 2**
C0	RET NZ	If {NZ} $PC_{(low)}$ = (SP); $PC_{(high)}$ = (SP + 1); SP = SP + 2
C8	RET Z	If {Z} $PC_{(low)}$ = (SP); $PC_{(high)}$ = (SP + 1); SP = SP + 2

Description

Rotates to the left with the Carry Flag, CF, the data whose address is:

- the data in word register HL, or
- the sum of the data in index register IX and a displacement *d*, or
- the sum of the data in index register IY and a displacement *d*.

Bits 0 through 6 move to the next highest-order bit position (bit 0 moves to bit 1, etc.) while the CF moves to bit 0 and bit 7 moves to the CF. See Figure 1 below.

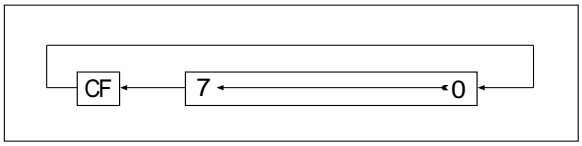

Figure 1: The bit logic of the RL instruction.

Example

If the HL contains 0x4545, the byte in the memory location 0x4545 is 0110 1010, and the CF is set, then after the execution of the operation

```
RL (HL)
```

The byte in memory location 0x4545 will contain 1101 0101 and the CF will be reset.

RL DE

Opcode	Instruction	Clocks	Operation
F3	RL DE	2	{CF,DE} = {DE,CF}

I/O	
S	D

Description

Pushes the current Program Counter, PC, onto the stack and then resets the PC to the interrupt vector address represented by **IIR:v**, where **IIR** is the address of the interrupt table and **v** is the offset into the table. The address of the vector table can be read and set by the instructions LD A,IIR and LD IIR,A respectively, where A is the upper nibble of the 16 bit vector table address. The vector table is always on a 100h boundary.

The push is accomplished by first loading the high-order byte of the PC into the memory location with the address 1 less than the number in the Stack Pointer, SP. Then the low-order byte of the PC is loaded into the memory location with the address two less than the number in the SP. The value in the SP is then decremented twice.

The PC is reset by loading it with the address to reset to **v** (any of the addresses 0020, 0030, 0040, 0050, or 0070).

Description

Subtracts the Carry Flag, CF, and the data whose address is:

- the data in word register HL, or
- the sum of the data in index register IX and a displacement *d*, or
- the sum of the data in index register IY and a displacement *d*

from the data in the Accumulator. The result is stored in the Accumulator.

These operations output an inverted carry:

- The Carry Flag is set if the Accumulator is less than the data being subtracted from it.
- The Carry Flag is cleared if the Accumulator is greater than the data being subtracted from it.

SBC A,*n*
SBC A,*r*

Opcode	Instruction	Clocks	Operation

Description

- **SBC A,*n*:** Subtracts the Carry Flag, CF, and the 8-bit constant *n* from the data in the Accumulator.
- **SBC A,*r*:** Subtracts the Carry Flag, CF, and the data in the register *r* (any of the registers A, B, C, D, E, H, or L) from the data in the Accumulator.

The difference is stored in the Accumulator.

These operations output an inverted carry:

- The Carry Flag is set if the Accumulator is less than the data being subtracted from it.
- The Carry Flag is cleared if the Accumulator is greater than the data being subtracted from it.

SBC HL,*ss*

•	

Description

Performs an exclusive OR operation between the data in the Accumulator and the data whose address is:

- the data in word register HL, or
- the sum of the data in index register IX and a displacement *d*, or
- the sum of the data in index register IY and a displacement *d*.

The corresponding bits of each byte are compared (i.e., the bit 1 of both bytes are compared, the bit 2 of both bytes are compared, etc.) and the associated bit in the result byte is set if and only if one of the two compared bits is set. The result is stored in the Accumulator.

Example

If the HL contains 0x4000 and the memory location 0x4000 contains the byte 1001 0101 and the Accumulator contains the byte 0101 0011 then the execution of the instruction

```
XOR (HL)
```

would result in the byte in the Accumulator becoming 1100 0110.

XOR *n*

Opcode	Instruction	Clocks	Operation
EE *n*	XOR *n*	4 (2,2)	A = [A & ~*n*] | [~A & *n*]

Description

Performs an exclusive OR operation between the byte in the Accumulator and the register *r* (any of the registers A, B, C, D, E, H, or L). The corresponding bits of each byte are compared (i.e., the bit 1 of both bytes are compared, the bit 2 of both bytes are compared, etc.) and the associated bit in the result byte is set if and only if one of the two compared bits is set. The result is stored in the Accumulator.

6. Quick Reference Table

Key

- **`Instruction`**: The mnemonic syntax of the instruction.
- **`Opcode`**: The binary bytes that represent the instruction.
- **`Clock cycles`**: The number of clock cycles that the instruction takes to complete. The numbers in parenthesis are a breakdown of the total clocks. For more information, please see Table 1: "Clocks Breakdown" on page 7.
- **`A`**: How the ALTD prefix affects the instruction. For more information, please see Table 2: "ALTD (“A” Column) Symbol Key" on page 8.
- **`I`**: How the IOI or IOE prefixes affect the instruction. For more information, please see Table 3: "IOI and IOE (“I” Column) Symbol Key" on page 8. A “b” in this column indicates that the prefix applies to both source and destination.
- **`S`**; **`Z`**; **`LV`**; **`C`**: These columns denote how the instruction affects the flags. For more information, please see Table 4: "Flag Register Key" on page 8.
- **`Operation`**: A symbolic representation of the operation performed.
- **`N/M/P`**: An “N” in this column indicates that the instruction has been added to the Z180 instruction set by the Rabbit 2000/3000. An “M” indicates that this instruction is from the Z180, but has been modified. A “P” indicates a privileged instruction.

Rabbit 2000/3000 Microprocessor Instruction Reference Manual

Part Number 019–0098 C • 020416 • Printed in U.S.A.

Notice to Users

Rabbit Semiconductor products are not authorized for use as critical components in life-support devices or systems unless a specific written agreement regarding such intended use is entered into between the customer and Rabbit Semiconductor prior to use. Life-support devices or systems are devices or systems intended for surgical implantation into the body or to sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling and user's manual, can be reasonably expected to result in significant injury.

No complex software or hardware system is perfect. Bugs are always present in a system of any size. In order to prevent danger to life or property, it is there responsibility of the system designer to incorporate redundant protective mechanisms appropriate to the risk involved.
