  - XBee 3 Cellular LTE-M/NB-IoT Low Power

KNOWN ISSUES

1. At the moment XBee Studio only supports XBee 3 Cellular devices.
2. UNIX-based operating systems allow you to open multiple instances of the same port. While Windows avoids this scenario, it can produce unexpected behaviors if you have the same port open simultaneously by different apps in Linux.
3. Cellular modem update over USB only works in Windows. In addition, it requires that the appropriate USB drivers are installed on the computer and the usage of either a Digi XBIB-CU-TH development board or own hardware that makes a USB port available to the PC.

UPDATE CONSIDERATIONS

Some versions are not upgradable through the built-in update system. In those cases, XBee Studio will ask you to download the full installer from the Digi website.

UPDATE BEST PRACTICES

There are two ways of getting this new version:

1. If you do not have XBee Studio installed on your computer, download and install the tool from the Digi website (https://www.digi.com/xbeestudio).
2. If you already have XBee Studio installed on your computer, open the tool and wait until it notifies you about the new update. Then, follow the process to install the new version. You can manually check for updates at any time from *Help > Check for updates*.

You should always run the latest version of XBee Studio.
